

Lab 6

Andrew Hopkins CM: 1164

1. Internationalization is the process of making sure your software is easily adapted to work with multiple languages and cultures. Localization is the process of making your software use a specific language and follow any other relevant culture issues.
2. They are important because they help your software reach a greater audience. If you design your program from the start to support i18n and l10n you can easily add support for a new language and start selling software to them as well.
